

Maintenance Ops

A simple how-to guide for engineers and administrators

What is this tool? It keeps track of every pump, blower, valve and other equipment across your plants, tells you what maintenance is due, records what work was done on which parts, and turns that into sign-off reports you can share with clients.

In this guide	What you will find
Getting started	Signing in, what your role can see, notifications, using it on a phone.
For engineers	Your daily flow: pick up a task, do the work, close it out, report a breakdown.
For administrators	Equipment and parts, the Review queue, health scores, plants, team, reports.
Quick reference	A one-page cheat sheet and answers to common questions.

Open the tool at mihirsethidp.github.io/Maintenance-module in any browser on a computer or phone - and install it on your phone from the browser menu so it opens like an app, even without signal.

1. Getting started

Everyone starts here, whatever your role.

Signing in

1. Open mihirsethidp.github.io/Maintenance-module in your browser.
2. Enter the email address and password you were given, then press **Sign in**.
3. If you were invited by email, click the link in that invitation first and choose your own password.

Forgot your password? Type your email on the sign-in screen, then press **Forgot password?** just below the Sign in button. A reset link arrives by email and brings you straight back to choose a new password.

What you can see depends on your role

Role	What you can do
Engineer	See Equipment , Maintenance Log and Engineering Corner for the plants assigned to you. Start and complete maintenance, report breakdowns, generate visit reports.
Admin	Everything an engineer can do, across all plants, plus the Dashboard , Review , Plants and Team tabs: add equipment and plants, approve researched parts, invite engineers, assign plants.
Superadmin	Everything an admin can do, and is the only role that can make someone an Admin or remove one.

If you are an engineer and cannot find a plant or a piece of equipment, it simply means it has not been assigned to you. Ask your administrator.

The notification bell

The bell at the top right is your to-do list. A red number means there is something that needs attention. Click it to see:

- **Overdue** - work that should already have been done.
- **Due today** - scheduled jobs ready to start today.
- **Health alerts** - equipment whose condition has dropped into "At Risk" or "Critical".
- **Recent activity** - breakdowns, completed jobs and finished parts research (administrators only).

Every notification is a link: tap it and you land on that exact equipment (or the Review queue). Use the plant dropdown and the time buttons at the top to narrow the list, and **Mark all read** to clear the red badge.

Finding things

Every list page has a search box that **suggests real names as you type** - equipment, makes, models, plants, people - so you never have to guess a spelling. Pick a suggestion or keep typing; the list filters as you go.

Using it on your phone

The tool is built for phones, which is how most engineers will use it in the plant. Open the site in your phone browser and choose **Add to Home screen** (or "Install app"): you get a proper app icon and it opens full screen. Tables slide sideways with your finger; the action buttons stay visible on the right while you slide.

No signal at the plant? The app still opens and shows everything from your last sync - equipment, tasks, full history - with an amber banner telling you how old the data is. Browsing works offline; saving needs a connection. If a save fails mid-blip, your entries stay in the form: reconnect and press the button again.

2. For engineers

Your day-to-day: what needs doing, and how to record what you did.

Start in the Engineering Corner

This is your workspace. It has three tabs:

Tab	What it shows
Pending	Scheduled tasks ready to start (created automatically from the maintenance plan), ongoing maintenance you have already started, and overdue work.
Upcoming PPM	Planned maintenance coming up in the next 30 days, so you can plan your visit.
Visit Reports	Everything you completed, grouped by day, ready to turn into a signed report.

Doing a scheduled job

1. Go to **Engineering Corner** and stay on the **Pending** tab.
2. Find the equipment under "Scheduled tasks ready to start". If the work will take a while, press **Start Work** so everyone can see the machine is being worked on. If you did the job on the spot, press **Complete now** instead - it records the start and the finish in one go.
3. Do the physical work on the machine.
4. Close it out: press **Mark Complete** (or open the equipment and press **Mark Operational**).

The form does the boring parts for you: your name is already filled in as the technician (change it if someone else did the work - new names are remembered and suggested next time), and the expected completion date starts at today.

Closing out a job properly

Maintaining a machine means maintaining its parts, so the closing form asks you exactly that:

- **Parts maintained** - for each part choose **Serviced**, **Replaced**, or leave it blank if you did not touch it. If a part had failed, it is highlighted in red and already set to Replaced.
- **Service guide** - a collapsed reference list of the usual service steps for that equipment type. Open it if you want a reminder; there is nothing to tick.
- **Completion notes** - optional for scheduled work: tap one of the ready-made phrases ("No abnormalities", "Tested OK") or write your own. For breakdowns, notes are required.

Then press **Confirm**, or **Confirm & Generate Service Report** if you want a signed PDF for this single job straight away.

Why the parts matter Recording which part you serviced or replaced builds each part's own service history and improves the machine's health score. Replacing a part that previously failed visibly repairs that score.

Reporting a breakdown

1. Find the equipment. The quickest way in the plant is to **scan the QR sticker** on the machine with your phone camera - it opens that exact equipment.
2. Press **Put in Maintenance**.
3. Set **Reason** to **Breakdown**. Two extra fields appear: choose the **affected part** if you know which one failed, and the **severity**.
4. Describe what happened - for breakdowns this is required, because it is the story the next person needs.
5. Press **Confirm**. The equipment is now flagged as broken down and your administrator is notified.

Replacing a valve or NRV

Valves are replaced, not repaired. Open the valve and press **Replace Valve** (or **Replace NRV**), then enter the new valve's tag and details. The old valve is retired but its full history is kept, and the new one takes over the same position.

Producing a visit report

1. Go to **Engineering Corner** then the **Visit Reports** tab.
2. Pick a date range using the quick filters (Today, Last 7 days, and so on).
3. Find your visit day and press **Generate Report** - the report window opens already set to that day.
4. Enter who prepared and who approved the work, then press **Preview** or **Download**. On a phone the PDF opens in your phone's own viewer or share sheet.

3. For administrators

Setting up the tool and keeping an eye on the whole fleet.

The Dashboard

Your daily overview. The four cards at the top count all equipment, and how much is operational, in maintenance, or broken down. **Click any card** to open the full Equipment list already filtered to that status. The table underneath lists everything currently out of service, with the reason, who is on it, and whether it is running late.

Adding equipment and its parts

1. Go to **Equipment** and press **Add Equipment**. Enter the make, model, type and plant - the equipment's **name is written for you** from Make + Model (a #2 is added if the same model already exists at that plant).
2. After saving you land on the new equipment's page, ready to record its parts.
3. In **Parts & specifications** press **Add part** for each part - name, specification, quantity and **criticality** from 1 to 10. **Save & add another** keeps the form open so a whole parts list is one continuous flow.
4. Or press **Auto-fill from web (AI)** to have the tool look up the manufacturer's datasheet - see the Review queue below for how this works at import scale.

What is criticality? It is how badly a failure of that part hurts the machine. A motor might be 10 (the machine stops), an air filter 2 (a minor job). It drives the health score. Engineers never see these numbers - they are an admin's planning tool.

The Review queue: parts research at import scale

When you import a PPM schedule, every pump, blower and motor is queued for automatic parts research in the background - the tool searches manufacturer datasheets while you do other things, and one notification tells you when the run is done. The **Review** tab is where you approve the results:

- One dropdown per plant, with counts of what is ready, what needs information, and what needs attention. Press **Quick approve** on the plant row to accept every ready draft at that plant in one go - anything flagged (only one part found, unusually high criticality, no source, auto-selected variant) is listed for you before anything saves.
- Each equipment row also has its own **Quick approve**, a **Review** button to check the draft part-by-part, and **Skip**.
- **Needs make & model** - the import had no make or model for these. Type them and press Save & research: the machine is renamed to Make + Model, its imported duty name moves to Location, and research starts.

- If a model exists in several versions (4.2 kW, 5.5 kW...), the most likely one is **selected automatically** and clearly flagged - check the flag before approving if precision matters.
- **Needs attention** - nothing reliable was found. Fix a spelling and **Retry**, add the parts manually, or **Dismiss**.

Equipment without recorded parts carries an amber "No parts recorded" hint on the Equipment list, so nothing falls through. Research runs while you have the tool open and resumes automatically next time.

Reading the health score

Every machine gets a score out of 100, shown on the equipment list and beside its name on its own page. Press the small ? next to the score to see exactly what pushed it up or down - there is no hidden calculation.

Band	Score	What it means
Good	80 to 100	Healthy. Keep to the maintenance plan.
Watch	60 to 79	Some history or age showing. Worth an eye.
At Risk	40 to 59	Repeated or serious failures. Raises an alert in the bell.
Critical	Below 40	Needs attention now. Raises an alert in the bell.

The score rises and falls with: the age of the machine against its expected life, how critical the failed parts were, how recently failures happened (old problems fade), whether work is overdue, and how consistently planned maintenance is completed on time.

Managing plants

The **Plants** tab is where you set each site up:

- **Add Plant** - create a new site, then add its equipment.
- **Import PPM** - upload a planned maintenance spreadsheet to load a whole site's equipment and schedule at once. You see a preview first, imported machines are named from their make and model, and the tool warns you if the same file looks like it was imported before.
- **QR Codes** - produce a printable sheet of QR stickers for every machine at that plant. Print, cut, and stick them on the equipment.
- **PPM Checklists** - edit the service guide steps shown to engineers when they close a job on each equipment type.

Managing your team

The **Team** tab lists everyone with access. For each person you can:

- **Invite User** - send an email invitation. They set their own password and join with the role you chose.
- **Assign plants** - choose which sites an engineer can see. An engineer with no plants assigned sees nothing, so this is the first thing to do after they join.
- **Edit** - update someone's name and phone number. Include the country code on phone numbers (for example +919000010000), as this will be used for WhatsApp alerts.
- **Generate Schedule** - produce a PDF of an engineer's upcoming and outstanding work for a day, week, month or custom range, to send them at the start of the period.

Below the users sits the **Technicians** list: every field technician ever named on a work-order, with how many jobs they have on record. New names typed on a job are added automatically and suggested next time; removing one never changes past records.

Records and reports

The **Maintenance Log** holds every job ever recorded. Filter by plant, equipment type, reason, status, technician, date range, or the suggesting search box. One **Report** button covers every sign-off document, with three scopes:

- **Current filters** - a report over exactly what the log is showing right now.
- **All equipment** - everything you have access to.
- **Single visit** - one day's completed work grouped by plant; the same report engineers reach from Visit Reports.

Export downloads the log as Excel or PDF, and individual equipment pages have their own Export for just that machine's history.

4. Quick reference

The short version - worth printing and pinning up.

I want to...

Task	Where to go
Start a scheduled job	Engineering Corner, Pending tab, then Start Work
Record a job done on the spot	Press Complete now next to the task - one step
Finish a started job	Equipment page, then Mark Operational
Report a breakdown	Scan the QR sticker, or find the equipment, then Put in Maintenance
Replace a valve	Open the valve, then Replace Valve
Approve researched parts	Review tab, then Quick approve (administrators)
See what is coming up	Engineering Corner, Upcoming PPM tab
Produce a visit report	Engineering Corner, Visit Reports , then Generate Report
Check a machine's condition	Equipment list Health column, then the ? beside the score
Add a machine	Equipment, then Add Equipment (administrators)
Record a machine's parts	Equipment page, Parts & specifications (administrators)
Give an engineer access	Team, then Assign plants (administrators)
Print QR stickers	Plants, then QR Codes (administrators)
Export records or reports	Maintenance Log, then Export or Report

Common questions

Why can I not see a plant or machine?

Engineers only see the plants assigned to them. Ask an administrator to assign it to you.

It says the equipment already has an open work-order.

Somebody has already started a job on that machine. Finish that one before starting another.

The breakdown form will not submit.

For breakdowns, describing what happened is required - it is the story the next person needs. For scheduled work, notes are optional.

I picked the wrong part when closing a job.

Ask an administrator: the record can be corrected. Recording it accurately matters, because it feeds the health score and the parts history.

What does "variant auto-selected" mean in the Review queue?

The model exists in several versions and the most likely one was chosen automatically. Press Review on that row to check it before approving if the exact version matters.

Can I use it without internet?

Yes, for looking things up: the app opens and shows everything from your last sync, with a banner showing how old the data is. Saving a job needs a connection - your entries stay in the form while you retry.

Does anything get sent to the customer automatically?

No. Reports are generated as PDFs for you to check and share yourself.

New since the last version of this guide

- **Works offline** - install it on your phone and it opens without signal, showing your last sync.
- **Complete now** - one step to record a job done on the spot.
- **Lighter forms** - your name and dates are pre-filled; notes are optional for scheduled work; the checklist is a reference, not a gate.
- **The Review queue** - imported equipment gets its parts researched automatically; admins approve a whole plant in one click.
- **Search that suggests** - every list offers real names as you type.
- **One Report button** - service and visit reports are the same flow now, with three scopes.

Need help? Contact your administrator, or Amit Gosain for anything to do with access, plants and equipment set-up.

DigitalPaani Maintenance Ops user guide. Because the tool is updated regularly, small differences between this guide and what you see on screen are normal.
