

Maintenance Ops

Team training — what the tool does, and what each of us does in it.

—— Every machine · every visit · signed proof

What this replaces

Memory

Service is skipped until the machine breaks down.

Phone calls

Nobody can prove what was done at a client site.

Loose notes

A problem someone spotted is forgotten by next week.

Silence

Stalled work is discovered weeks late, or never.

One place for what needs doing, who did it, and proof it happened.

Three roles, three jobs

TECHNICIAN

Does the work

- Sees only the jobs given to them
- Closes each one with notes and photos
- Reports parts that need attention
- Gets the client to sign

ENGINEER

Owens the plants

- Decides what gets done, and by whom
- Checks finished work before it counts
- Decides on reported problems
- Co-signs every service report

ADMIN

Sees everything

- The whole fleet, every plant
- Who is holding what up
- Adds people and sites
- Steps in when an engineer cannot

TECHNICIAN

A day, in four taps

1

Open My Work

Today's jobs are already there. Nothing to search for.

2

Start Work

Press it when you actually begin. Small job? Complete now.

3

Mark Complete

What you did, plus photos. Some jobs will not close without one.

4

It goes to check

Your engineer approves it, or sends it back with a note.

The machine goes back in service the moment you complete it. It never waits for the check.

TECHNICIAN

End of the visit: the report

One report covers everything you did at one plant on one day — the jobs, your notes, your photos, and anything else you did there. Three people sign it, in this order.

1 · You

My Work → Reports → Create & sign.
That signs it as you.

2 · Your engineer

He reads it and signs, or sends it
back with a note.

3 · The client

Hand them your phone. They sign
with a finger and type their name.

Collect the client signature before you leave the site.

The bell tells you the moment a report is ready for it. If the client is not there, it waits for your next visit — nothing is lost.

ENGINEER

Engineering Corner is your desk

Signing in lands you here. Across the top, **Needs your attention** — one chip per thing waiting on you. Tap a chip, land on the right tab. When nothing is waiting, the strip disappears.

Tab	What lives there
To start	Work due now, and overdue service. Assign it, or start it yourself.
Ongoing	Jobs being worked on right now. Reassign or put on hold from here.
Upcoming PPM	The next thirty days from the schedule. Plan the week ahead.
To review	Everything waiting on your verdict: finished work, reported problems, reports to sign.
Service reports	Every co-signed report — being signed, or signed and locked.

ENGINEER

Giving out the work

Assign

Jobs the schedule creates arrive assigned to nobody. Hand one over and it is on their phone at once.

Schedule for later

Plan a job up to sixty days out. The machine keeps running; the technician sees the date.

Reassign

Someone off sick, or the wrong person. The history stays with the job.

Put on hold

Waiting on a part or a shutdown. Say what for, and when you will check back.

A hold is not an excuse — it is an honest answer.

It pauses the overdue clock, so a job genuinely waiting on a vendor stops looking like neglect. You do not need to know when the part arrives — only when you will chase it.

ADMIN

Two pages, two questions

Dashboard

Is anything broken?

Total machines, operational, in maintenance, broken down. Tap a card to open that list. Below it, everything out of service and who is on it.

Oversight

Who is holding what up?

Work nobody checked, jobs sent back and forgotten, problems with no decision, signatures still missing — oldest first, each one a link.

Adjust the clocks

You decide how many days count as too long. Your numbers, your page, your email.

The 7 a.m. email

What is overdue, due, and waiting on someone. Nothing outstanding means no email at all.

THE POINT OF ALL OF IT

Once the client signs, the report can never be changed.

Not by the technician, not by the engineer, not by an administrator. Every signature is stamped over a fingerprint of the contents, so a signed report is the same document a year from now as it was on the day.

Found a mistake?

Corrections are new reports, never edits to the old one.

More work that day?

A second report covers only the new jobs. The signed one is untouched.

Need a copy?

Download the PDF any time. It is identical every time it is produced.

Five things that surprise people

What happens	Why it works that way
The machine is released the instant a job is completed	The work is physically done. The check is about the record, never the equipment.
Finished work waits for an engineer before it counts	Two pairs of eyes on anything a client will eventually see.
Dates cannot be invented	Never a future date, thirty days back at most — and a late entry says so on the record.
Reporting a problem never blocks finishing the job	Nobody should have to choose between reporting a fault and closing their work.
Nobody can be switched off mid-job	Open work must be handed to someone else first, so no job is ever orphaned.

No signal? Keep working.

Plant rooms and basements have no bars. The app expects that. Start a job, finish it, add photos, report a problem — all of it saves on the phone and sends itself the moment you have signal again.

What you see

An orange bubble in the corner: what is waiting to send. Tap it any time to look, or to send it now.

What to do

Nothing. Work normally. It sends when the signal returns — you do not have to remember anything.

The one rule

Do not clear your browser or remove the app while the orange bubble is showing.

Install the app to the home screen on your first day, with signal, so it is ready before you ever need it offline.

Spotted something? Say so.

A weeping seal or a noisy bearing you report today is a small job. Left alone it is a breakdown next month — and an angry client.

ANYONE

Report it

While closing a job, or from the machine's page at any time. Say whether it needs servicing, repair or replacement.

ENGINEER

Decide it

Schedule the work, mark it already handled, or dismiss it — and dismissing always needs a reason.

CLIENT

Sees it

What you found goes into the service report, so the client knows what we spotted on their site.

Reporting a problem takes twenty seconds and never stops you closing the job.

Week one

TECHNICIAN

- Set your own password
- Install the app, open it once on Wi-Fi
- Take one photo on a real job
- Close one visit end to end

ENGINEER

- Assign the week's work on Sunday evening
- Clear the attention strip each morning
- Review the same day work is submitted
- Co-sign the first report with the technician beside you

ADMIN

- Set your clocks in the first fortnight
- Read Oversight once a day
- Check the 7 a.m. email actually arrives
- Chase the first stalled item personally

One rule above all: if the work went through the tool, it happened. If it did not, it did not.

When you get stuck

Every role has a short guide — six pages, plain language, with a quick-reference page at the back that is meant to be printed and pinned up.

Technician guide

My Work, photos, reports, signatures, no-signal working.

Engineer guide

Assigning, planning ahead, reviewing, holds, co-signing.

Admin guide

Dashboard, Oversight, clocks, team, imports, storage.

— Anything the guides do not answer — tell us. That is how the next version gets written.
