

Maintenance Ops

A simple how-to guide for engineers and administrators

What is this tool? It keeps track of every pump, blower, valve and other equipment across your plants, tells you what maintenance is due, records what work was done on which parts, and turns that into sign-off reports you can share with clients.

In this guide	What you will find
Getting started	Signing in, what your role can see, notifications, using it on a phone.
For engineers	Your daily flow: pick up a task, do the work, close it out, report a breakdown.
For administrators	Equipment and parts, health scores, plants, team, reports.
Quick reference	A one-page cheat sheet and answers to common questions.

Open the tool at mihirsethidp.github.io/Maintenance-module in any browser on a computer or phone. Nothing to install.

1. Getting started

Everyone starts here, whatever your role.

Signing in

1. Open mihirsethidp.github.io/Maintenance-module in your browser.
2. Enter the email address and password you were given, then press **Sign in**.
3. If you were invited by email, click the link in that invitation first and choose your own password.

Forgot your password? Ask your administrator to send you a fresh invitation. For your own security, nobody can see or tell you your existing password.

What you can see depends on your role

Role	What you can do
Engineer	See Equipment , Maintenance Log and Engineering Corner for the plants assigned to you. Start and complete maintenance, report breakdowns, generate visit reports.
Admin	Everything an engineer can do, across all plants, plus the Dashboard , Plants and Team tabs: add equipment and plants, invite engineers, assign plants, configure notifications.
Superadmin	Everything an admin can do, and is the only role that can make someone an Admin or remove one.

If you are an engineer and cannot find a plant or a piece of equipment, it simply means it has not been assigned to you. Ask your administrator.

The notification bell

The bell at the top right is your to-do list. A red number means there is something that needs attention. Click it to see:

- **Overdue** - work that should already have been done.
- **Due today** - scheduled jobs ready to start today.
- **Health alerts** - equipment whose condition has dropped into "At Risk" or "Critical".
- **Recent activity** - breakdowns and completed jobs (administrators only).
- **Upcoming** - the next seven days of planned maintenance (administrators only).

Use the two dropdowns at the top of the panel to narrow the list to one plant or a time period, and **Mark all read** to clear the red badge.

Using it on your phone

The tool is built to work on a phone, which is how most engineers will use it in the plant. Tables slide sideways with your finger when there are more columns than fit. For quick access, open the site in your phone browser and use "Add to Home screen" so it behaves like an app.

2. For engineers

Your day-to-day: what needs doing, and how to record what you did.

Start in the Engineering Corner

This is your workspace. It has three tabs:

Tab	What it shows
Pending	Scheduled tasks ready to start (created automatically from the maintenance plan), ongoing maintenance you have already started, and overdue work.
Upcoming PPM	Planned maintenance coming up in the next 30 days, so you can plan your visit.
Visit Reports	Everything you completed, grouped by day, ready to turn into a signed report.

Doing a scheduled job

1. Go to **Engineering Corner** and stay on the **Pending** tab.
2. Find the equipment under "Scheduled tasks ready to start" and press **Start Work**. The equipment is now marked as in maintenance, so everyone knows it is being worked on.
3. Do the physical work on the machine.
4. Press **Mark Complete** (or open the equipment and press **Mark Operational**).
5. Fill in the closing form - this is the important part, described below.

Closing out a job properly

Maintaining a machine means maintaining its parts, so the closing form asks you exactly that:

- **Parts maintained** - for each part choose **Serviced**, **Replaced**, or leave it blank if you did not touch it. If a part had failed, it is highlighted in red and already set to Replaced.
- **Service checklist** - tick off the safety and service steps. Items marked with a star are compulsory: the tool will not let you close the job until those are ticked.
- **Completion date** and **completion notes** - a short summary of what you found and did.

Then press **Confirm**, or **Confirm & Generate Service Report** if you want a signed PDF for this single job straight away.

Why the parts matter Recording which part you serviced or replaced builds each part's own service history and improves the machine's health score. Replacing a part that previously failed visibly repairs that score.

Reporting a breakdown

1. Find the equipment. The quickest way in the plant is to **scan the QR sticker** on the machine with your phone camera - it opens that exact equipment.
2. Press **Put in Maintenance**.
3. Set **Reason** to **Breakdown**. Two extra fields appear: choose the **affected part** if you know which one failed, and the **severity**.
4. Set the **priority**, the **expected completion** date, your name, and describe what happened.
5. Press **Confirm**. The equipment is now flagged as broken down and your administrator is notified.

Replacing a valve or NRV

Valves are replaced, not repaired. Open the valve and press **Replace Valve** (or **Replace NRV**), then enter the new valve's tag and details. The old valve is retired but its full history is kept, and the new one takes over the same position.

Producing a visit report

1. Go to **Engineering Corner** then the **Visit Reports** tab.
2. Pick a date range using the quick filters (Today, Last 7 days, and so on).
3. Find your visit day and press **Generate Report**.
4. Enter who prepared and who approved the work, then press **Preview** to check it, or **Download** to save the PDF for signing.

3. For administrators

Setting up the tool and keeping an eye on the whole fleet.

The Dashboard

Your daily overview. The four cards at the top count all equipment, and how much is operational, in maintenance, or broken down. **Click any card** to filter the table underneath it. The table lists everything currently out of service, with the reason, who is on it, and whether it is running late.

Adding equipment and its parts

1. Go to **Equipment** and press **Add Equipment**. Enter the name, type, make, model, plant and installation date.
2. Open the equipment you just created.
3. In the **Parts & specifications** section press **Add part** for each part: its name, specification (for example "6309-2Z, 45mm bore"), quantity, and **criticality** from 1 to 10.
4. Alternatively press **Auto-fill from web (AI)** to have the tool look up the manufacturer's datasheet for you - see below.

What is criticality? It is how badly a failure of that part hurts the machine. A motor might be 10 (the machine stops), an air filter 2 (a minor job). This is what makes the health score meaningful, so it is worth thinking about for a moment.

Filling in parts automatically

If the make and model are filled in, **Auto-fill from web (AI)** searches the manufacturer's technical datasheets and drafts the parts list for you.

- If several versions of that model exist (for example a 4.2 kW and a 5.5 kW), you are asked to pick the right one.
- If only one version exists, it goes straight to a draft.
- **Nothing is saved until you approve it.** You see every suggested part with its source link, can untick anything wrong, and can adjust the criticality before saving.

Reading the health score

Every machine gets a score out of 100, shown on the equipment list and on its own page. Press **Why this score?** to see exactly what pushed it up or down - there is no hidden calculation.

Band	Score	What it means
Good	80 to 100	Healthy. Keep to the maintenance plan.
Watch	60 to 79	Some history or age showing. Worth an eye.
At Risk	40 to 59	Repeated or serious failures. Raises an alert in the bell.
Critical	Below 40	Needs attention now. Raises an alert in the bell.

The score rises and falls with: the age of the machine against its expected life, how critical the failed parts were, how recently failures happened (old problems fade), whether work is overdue, and how consistently planned maintenance is completed on time.

Managing plants

The **Plants** tab is where you set each site up:

- **Add Plant** - create a new site, then add its equipment.
- **Import PPM** - upload a planned maintenance spreadsheet to load a whole site's equipment and schedule at once. You see a preview before anything is saved.
- **QR Codes** - produce a printable sheet of QR stickers for every machine at that plant. Print, cut, and stick them on the equipment.
- **Configure Notifications** - choose who gets told about which event, and on which channel.
- **PPM Checklists** - edit the service checklist for each equipment type. Start a line with a star to make that step compulsory.

Managing your team

The **Team** tab lists everyone with access. For each person you can:

- **Invite User** - send an email invitation. They set their own password and join with the role you chose.
- **Assign plants** - choose which sites an engineer can see. An engineer with no plants assigned sees nothing, so this is the first thing to do after they join.
- **Edit** - update someone's name and phone number. Include the country code on phone numbers (for example +919000010000), as this will be used for WhatsApp alerts.
- **Generate Schedule** - produce a PDF of an engineer's upcoming and outstanding work for a day, week, month or custom range, to send them at the start of the period.

Records and reports

The **Maintenance Log** holds every job ever recorded. Filter by plant, equipment type, reason, status, technician, date range, or free text search. From there:

- **Service Report** - a consolidated sign-off PDF covering either what is currently filtered, or everything.
- **Export** - download the log as an Excel file or a PDF.

Individual equipment pages also have their own **Export** for just that machine's history.

4. Quick reference

The short version - worth printing and pinning up.

I want to...

Task	Where to go
Start a scheduled job	Engineering Corner, Pending tab, then Start Work
Finish a job	Equipment page, then Mark Operational (or Mark Complete in Pending)
Report a breakdown	Scan the QR sticker, or find the equipment, then Put in Maintenance
Replace a valve	Open the valve, then Replace Valve
See what is coming up	Engineering Corner, Upcoming PPM tab
Produce a visit report	Engineering Corner, Visit Reports tab
Check a machine's condition	Equipment list Health column, then Why this score?
Add a machine	Equipment, then Add Equipment (administrators)
Record a machine's parts	Equipment page, Parts & specifications (administrators)
Give an engineer access	Team, then Assign plants (administrators)
Print QR stickers	Plants, then QR Codes (administrators)
Export records	Maintenance Log, then Export

Common questions

Why can I not see a plant or machine?

Engineers only see the plants assigned to them. Ask an administrator to assign it to you.

The tool will not let me close a job.

One or more compulsory checklist items are unticked. They are marked with a star. Tick them and try again.

It says the equipment already has an open work-order.

Somebody has already started a job on that machine. Finish that one before starting another.

I picked the wrong part when closing a job.

Ask an administrator: the record can be corrected. Recording it accurately matters, because it feeds the health score and the parts history.

Does anything get sent to the customer automatically?

No. Reports are generated as PDFs for you to check and share yourself.

Can I use it without internet?

No. The tool needs a connection so that everyone sees the same, up-to-date information.

Need help? Contact your administrator, or Amit Gosain for anything to do with access, plants and equipment set-up.

DigitalPaani Maintenance Ops user guide. Because the tool is updated regularly, small differences between this guide and what you see on screen are normal.
