

Service Engineer Guide

Your sites, your team, your sign-off

What is this tool? You own your plants in it: the equipment register, the work orders you assign to technicians, the review of what they did, the issues they report, and the service reports you and the client co-sign.

In this guide	What you will find
Getting set up	Signing in, the app on your phone, what you own.
Running the work	Creating work orders, assigning technicians, photos.
The review loop	Approving, sending back, reassigning, closing as-is.
Issues and holds	Deciding on what technicians find; pausing blocked jobs honestly.
Service reports	Co-signing, or preparing the report yourself.
Quick reference	A cheat sheet and answers to common questions.

Open the tool at mihirsethidp.github.io/Maintenance-module on your phone or computer. Install it from the browser menu so it opens like an app, even without signal.

1. Getting set up

Five minutes, once.

Signing in

1. You will receive an **email invitation**. Open it and choose your own password.
2. After that, sign in at **mihirsethidp.github.io/Maintenance-module** with your email and password.
3. Forgot the password? Type your email on the sign-in screen and press **Forgot password?**.

Install it on your phone

Your phone	How to install the app
iPhone	Open the site in Safari , tap the Share button (square with an arrow), then Add to Home Screen . A "Maintenance" icon appears like any other app.
Android	Open the site in Chrome , tap the three-dot menu , then Add to Home screen (or Install app).

No signal at the plant? The app still opens and shows everything from your last sync, with an amber banner telling you how old the data is. Technicians can even finish jobs and report problems with no signal at all — the phone keeps the work and sends it by itself when the connection returns. Other actions (reviews, new work orders, signatures) need a connection.

What you own

Signing in lands you straight in **Engineering Corner** — your workspace. Across the top sits **Needs your attention**: one chip for each thing waiting on you (finished work to check, problems reported, reports to sign, overdue maintenance...), and one tap opens the right place. When nothing waits, the strip disappears. The Engineering Corner tab in the menu also carries a red count, and every bell notification opens the exact tab the item lives in.

You see the plants assigned to you, across four tabs: **Equipment**, **Maintenance Log**, **Engineering Corner** and **Team**. At your plants you can **add and edit equipment** (press **Add Equipment** — the machine's name is written for you from Make + Model). On Team you see the technicians and can **Invite Technician** when you take on new field staff.

Every job created since late August carries a **number like WO-2026-0147**. It shows on the job, in the log, and on service reports — use it when you talk about a job on the phone. Older jobs from before numbering have none.

2. Running the work

You create the jobs; technicians execute them.

Creating and assigning a work order

1. Find the machine and press **Put in Maintenance** (or start from the schedule in Engineering Corner — PPM jobs create themselves).
2. Pick the technician in **Assign to** — the list shows each one's current open jobs, so you don't overload someone blind. The job lands in their **My Work** the moment you save.
3. Tick **Require photos on completion** if you want evidence before you approve. **Breakdowns require photos regardless.**
4. No account for the person doing the work? Type any name — the job follows the old flow and closes without review.

Planning ahead

Work does not have to start today to exist. **Schedule for later** (on the machine's page) or **Schedule & assign** (on any Upcoming PPM row) creates the job for a future day — up to 60 days out. The machine keeps running, the job waits under **To start** → **Coming up**, and the technician sees it in My Work marked "**Starts <date>**" the moment you assign it — so Monday evening you can lay out the whole week. When work really begins, **Start Work** stamps the true start date: plans can be in the future, records never are. The schedule also creates its own jobs **3 days before** their due date now, so they are assignable in advance.

Jobs the PPM schedule creates by itself arrive **assigned to nobody**. They wait on the **To start** tab showing "Not assigned to anyone yet" — press **Assign** on the row to hand one to a technician. **Start Work** there means "I am doing this job myself" — the tool asks you to confirm, because your name goes on the work order.

A note, not a job? If a machine needs attention **later** but keeps running, do not put it in maintenance — use **Report issue** on the machine instead. Put in Maintenance takes it out of service and starts the overdue clock; Report issue just gets it on your list.

When photos cannot happen

A dark pit, a dead camera — sometimes the evidence rule has to bend. On the machine's page, **Photos: required** switches to **Photos: optional** (and back) while the job is open. Waiving is never silent: the review card says **photos waived** and by whom, so approving a photo-less job is a decision on record, not an oversight.

Doing a job yourself

Work you complete yourself closes directly — the review ceremony exists for delegation, not for its own sake. Your Visit Reports tab still builds your own sign-off PDFs as before.

3. The review loop

A technician's completed job lands with you before it counts.

When a technician completes a job it becomes **Awaiting review** in the **To review** tab of Engineering Corner. The machine is already back in service — your review is about the record, never about holding equipment hostage.

You press	What happens
Approve	The job closes for good.
Send back	You write what is missing ("add a photo of the replaced seal"). The technician sees your note at the top of My Work, fixes the record, and sends it back to you.
Reassign	Hands an open or stuck job to a different technician — with their open-job counts shown. A returned job handed to someone new starts fresh: they complete it themselves instead of inheriting "fix and send again" for work they never did.
Close as-is	On a returned job the technician never fixed: accept the record as it stands instead of waiting forever.

Each card shows the completion notes and the photos. Look at the photos — they are what the client will see in the report. Two small labels earn a second look when they appear: **"recorded N days after the work"** (the completion was saved later than it is dated — normal for offline work, worth a question otherwise) and **"photos waived"**.

4. Issues and holds

What was found, and what is honestly blocked.

Issues: deciding on what technicians report

When anyone reports a part needing service, repair or replacement, it appears in your **To review** tab under **Reported issues**, and as an amber strip on the machine's page. Three verdicts:

- **Schedule work** — opens the work-order form prefilled from the issue and links the job back to it.
- **Handled** — it was already dealt with; no follow-up needed.
- **Dismiss** — nothing will be done, and you must say why. That reason is the record the next person reads.

Holds: when a job is genuinely blocked

A job waiting on a vendor, a shutdown window or an approval should not read as neglect. On the machine's page press **Put on hold**:

- Say **what it is waiting on** (vendor / shutdown window / site access / approval) and the details.
- Set the **Check back on** date. This is **not** a promise the work will be done — you do not need to know when the vendor delivers, only when you will chase them. Presets: 3 days, a week, 2 weeks, a month.
- The job's overdue clock pauses until that date. When it passes, the job counts as overdue again and appears on the admin's Oversight page as a passed check-back — so extend it (**Extend hold**) or release it (**Release hold**) before then.

Extensions are counted A hold extended again and again is visible to your admin as a pattern — that is deliberate. A part that has been "on order" five times is an escalation, not a maintenance task.

5. Service reports

Three signatures make the work official.

One report covers everything a technician finished at one plant on one day — jobs, notes, photos, and the issues they raised. The signature order is fixed: **technician** → **you** → **the client**.

The two ways a report gets made

Path	How it goes
Technician raises it	They press Create & sign in My Work → Reports. It lands in your To review tab under Service reports : press View to read it, then Approve & sign — or Request changes with a note, and they fix it and send it again.
You prepare it	When you approve the last job of a visit, the tool offers the report immediately — Create & sign report . One press compiles and signs it. Any fully-approved visit without a report also waits in Visits ready for a report , so nothing is lost if you dismiss the prompt.
New work after signing	If more jobs from that day are approved after the client signed, the day qualifies again — the extra report covers only the new jobs and is marked as an addition to the signed one, which stays locked.

Either way, the last step is the client signing — usually **on the technician's phone** at the plant. If you are the one with the client, reports you have signed wait in **To review** under **Waiting for the client's signature**: press **Client sign-off** and hand over your own phone. Once the client signs, the report locks: no edits, ever — corrections are new reports. Every signature is stamped over a fingerprint (hash) of the content, and the locked report can be saved as a PDF any time — open it and press **Download PDF**.

6. Quick reference

The short version.

I want to...

Task	Where
Create a job for a technician	The machine → Put in Maintenance → pick them in Assign to
Plan a job for a later day	The machine → Schedule for later , or Schedule & assign on an Upcoming PPM row
Demand photo evidence	Tick Require photos on completion when creating the job
Review completed work	Engineering Corner → To review
Send work back for fixes	Send back on the card, with a note
Hand a job to someone else	Reassign — on the machine's page or the review tab
Pause a blocked job honestly	The machine → Put on hold , with a check-back date
Note a problem for later	The machine → Report issue (machine keeps running)
Deal with a reported issue	To review → Schedule work / Handled / Dismiss
Sign a technician's report	To review → Service reports → Approve & sign
Prepare the report yourself	Create & sign report after approving the last job
Add a machine at your plant	Equipment → Add Equipment
Bring in a new technician	Team → Invite Technician

Common questions

The technician completed the job — why is the machine already "Operational"?

By design. The work is physically done at completion; your review is about the record. A machine never waits on paperwork.

I sent a job back and nothing has happened for days.

It is waiting on the technician. You can Reassign it, or accept the record with Close as-is. Your admin sees the wait on Oversight either way.

A job is blocked on a part with no delivery date.

Put it on hold with a check-back date. You are not promising the part arrives — only that you will chase it on that date.

Can I make the service report without waiting for the technician?

Yes — once every job of the visit is approved. The tool offers it at the moment of the last approval, and lists it under Visits ready for a report afterwards.

Why can't I edit a signed report?

The client's signature locks it — that is what makes it proof. Work finished later that day goes into an additional report (the tool offers it); anything else is corrected in a new report.

Who sees the ageing clocks?

Your admin, on the Oversight page: unreviewed work, jobs sent back, issues with no decision, outstanding signatures, and passed check-backs — each with how long it has waited.

Need help? Contact your administrator for access and plants. The tool improves regularly; small on-screen differences from this guide are normal.
