

Administrator Guide

Running the fleet: setup, team, records and reports

What is this tool? It keeps track of every pump, blower, valve and other equipment across your plants, tells everyone what maintenance is due, records what work was done, and turns that into sign-off reports you can share with clients.

In this guide	What you will find
Getting started	Signing in, roles, notifications and the daily email summary.
Your daily overview	The Dashboard: fleet status at a glance, and what is out of service.
Setting things up	Plants, equipment, PPM imports, QR stickers, checklists.
Your team	Inviting engineers, assigning plants, schedules, deactivation.
Records and reports	The maintenance log, filters, sign-off reports, exports.
Quick reference	A cheat sheet and answers to common questions.

Open the tool at mihirsethidp.github.io/Maintenance-module on your phone or computer. Install it from the browser menu so it opens like an app, even without signal.

1. Getting started

Access, roles, and how the tool keeps you informed.

Signing in

1. Open mihirsethidp.github.io/Maintenance-module and sign in with your email and password.
2. Forgot the password? Type your email on the sign-in screen and press **Forgot password?**.

Your phone	How to install the app
iPhone	Open the site in Safari , tap the Share button (square with an arrow), then Add to Home Screen . A "Maintenance" icon appears like any other app.
Android	Open the site in Chrome , tap the three-dot menu , then Add to Home screen (or Install app).

On a phone, every list shows as a stack of **cards**: the equipment name comes first, its details underneath, and the action button at the bottom of the card. Filters sit in neat pairs above the list. Nothing scrolls sideways.

No signal at the plant? The app still opens and shows everything from your last sync - equipment, tasks, full history - with an amber banner telling you how old the data is. Browsing works offline; saving needs a connection. If a save fails mid-blip, your entries stay in the form: reconnect and press the button again.

Roles

Role	What they can do
Engineer	See Equipment , Maintenance Log and Engineering Corner for the plants assigned to them. Start and complete maintenance, report breakdowns, generate visit reports.
Admin	Everything an engineer can do, across all plants, plus the Dashboard , Plants and Team tabs: add equipment and plants, import schedules, invite engineers, assign plants.
Superadmin	Everything an admin can do, and is the only role that can make someone an Admin or remove one.

How the tool keeps you informed

- **The bell** (top right) - overdue work, jobs due today, and recent activity such as breakdowns and completions. Every notification is a link to the exact equipment.
- **The daily email summary** - one email each morning around 7:00 listing what is overdue, due today and scheduled across your plants. On a day with nothing outstanding, no email is sent.
- **Breakdown alerts** - emailed the moment a machine is reported broken down.

Both email types can be switched on or off per person: **Team** → **Edit** on that person. An engineer's emails only cover the plants assigned to them.

2. Your daily overview

The Dashboard answers "is anything wrong?" in one look.

The four cards at the top count all equipment, and how much is operational, in maintenance, or broken down. **Tap any card** to open the Equipment list already filtered to that status. Below them, **Currently out of service** lists every machine that is down, with the reason, who is on it, and whether it is running late.

How "overdue" is counted Overdue starts from the day a machine entered the tool - a freshly imported plant starts with a clean slate rather than a fabricated backlog of dates that passed before the tool knew the machine existed.

3. Setting things up

Plants first, then equipment - or both at once with an import.

Plants

- **Add Plant** - create a new site, then add its equipment.
- **Import PPM** - upload a planned maintenance spreadsheet to load a whole site's equipment and schedule at once. You see a preview first, imported machines are named from their make and model, and the tool warns you if the same file looks like it was imported before.
- **QR Codes** - a printable sheet of QR stickers for every machine at that plant. Print, cut, stick them on the equipment: engineers scan them to open the right machine instantly.
- **PPM Checklists** - edit the service-guide steps engineers see when they close a job on each equipment type.

Adding a single machine

1. Go to **Equipment** and press **Add Equipment**.
2. Enter the make, model, type and plant - the equipment's **name is written for you** from Make + Model (a #2 is added if the same model already exists at that plant).
3. Save. The machine appears on the list, ready for maintenance records.

4. Your team

People, access, and their work schedules.

The **Team** tab lists everyone with access. For each person:

- **Invite User** - send an email invitation. They set their own password and join with the role you chose.
- **Assign plants** - choose which sites an engineer can see. **An engineer with no plants assigned sees nothing** - this is the first thing to do after they join, and their email summaries stay empty until it is done.
- **Edit** - update someone's name, phone number and **email notification settings** (daily summary and breakdown alerts, per person). Include the country code on phone numbers, for example +919000010000.
- **Generate Schedule** - a PDF of an engineer's upcoming and outstanding work for a day, week, month or custom range, with the plant named on every line - send it to them at the start of the period.
- **Deactivate** - switch someone's access off. Reversible: their records stay, and Reactivate restores them. Only the Superadmin can deactivate an Admin.

Below the users sits the **Technicians** list: every field technician ever named on a work-order, with how many jobs they have on record. New names typed on a job are added automatically and suggested next time; removing one never changes past records.

5. Records and reports

Everything ever recorded, and the documents it becomes.

The **Maintenance Log** holds every job. Filter by plant, equipment type, reason, status, technician, date range, or the search box that suggests real names as you type. One **Report** button covers every sign-off document, with three scopes:

- **Current filters** - a report over exactly what the log is showing right now.
- **All equipment** - everything you have access to.
- **Single visit** - one day's completed work grouped by plant; the same report engineers reach from Visit Reports.

Export downloads the log as Excel or PDF, and each equipment page has its own Export for just that machine's history.

6. Quick reference

The short version - worth printing and pinning up.

I want to...

Task	Where to go
See fleet status at a glance	Dashboard - tap a card to open that list
Add a machine	Equipment, then Add Equipment
Load a whole plant at once	Plants, then Import PPM
Print QR stickers	Plants, then QR Codes
Edit service-guide steps	Plants, then PPM Checklists
Invite an engineer	Team, then Invite User
Give an engineer access to a site	Team, then Assign plants
Send an engineer their week's work	Team, then Generate Schedule
Turn someone's emails on or off	Team, then Edit on that person
Remove someone's access	Team, then Deactivate
Export records or reports	Maintenance Log, then Export or Report

Common questions

An engineer says they cannot see their plant.

Open Team and press Assign plants on their row - an engineer with no plants assigned sees nothing.

Why did no summary email arrive this morning?

On a day with nothing overdue, due or scheduled, no email is sent - silence means all clear. Emails also only cover plants the person can see.

A machine shows overdue but we only just added it.

Overdue only counts from the day the machine entered the tool, so this should not happen - if it does, check whether the maintenance date on the imported schedule was already in the past.

Can I undo a deactivation?

Yes - Deactivate is reversible. The person's records stay, and Reactivate restores their access.

Does anything get sent to the customer automatically?

No. Reports are generated as PDFs for you to check and share yourself.

I have heard about health scores and parts lists. Where are they?

They exist, switched off for a simpler tool. Everything recorded today feeds them - if they are switched on later, your history counts from day one.

Need help? Contact Mihir Sethi for anything to do with accounts, email notifications or the tool itself. The tool improves regularly; small on-screen differences from this guide are normal.
