

# Field Engineer Guide

Your phone is the tool - here is your day in it

**What is this tool?** It shows you what maintenance is due at your plants, records the work you do, and turns your completed jobs into signed visit reports - all from your phone.

| In this guide   | What you will find                                              |
|-----------------|-----------------------------------------------------------------|
| Getting set up  | Signing in, installing the app on your phone, what you can see. |
| Your daily flow | Pick up a task, do the work, close it out, report a breakdown.  |
| Visit reports   | Turning a day of completed work into a signed PDF.              |
| Quick reference | A cheat sheet and answers to common questions.                  |

Open the tool at [mihirsethidp.github.io/Maintenance-module](https://mihirsethidp.github.io/Maintenance-module) on your phone or computer. Install it from the browser menu so it opens like an app, even without signal.

# 1. Getting set up

Five minutes, once.

## Signing in

1. You will receive an **email invitation**. Open it and choose your own password.
2. After that, sign in at [mihirsethidp.github.io/Maintenance-module](https://mihirsethidp.github.io/Maintenance-module) with your email and password.
3. Forgot the password? Type your email on the sign-in screen and press **Forgot password?** - a reset link arrives by email.

## Install it on your phone

| Your phone | How to install the app                                                                                                                                                 |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| iPhone     | Open the site in <b>Safari</b> , tap the <b>Share</b> button (square with an arrow), then <b>Add to Home Screen</b> . A "Maintenance" icon appears like any other app. |
| Android    | Open the site in <b>Chrome</b> , tap the <b>three-dot menu</b> , then <b>Add to Home screen</b> (or <b>Install app</b> ).                                              |

On a phone, every list shows as a stack of **cards**: the equipment name comes first, its details underneath, and the action button at the bottom of the card. Filters sit in neat pairs above the list. Nothing scrolls sideways.

**No signal at the plant?** The app still opens and shows everything from your last sync - equipment, tasks, full history - with an amber banner telling you how old the data is. Browsing works offline; saving needs a connection. If a save fails mid-blip, your entries stay in the form: reconnect and press the button again.

## What you can see

You see three tabs - **Equipment**, **Maintenance Log** and **Engineering Corner** - covering the plants assigned to you. If a plant or machine is missing, it has not been assigned to you yet: ask your administrator.

The **bell** at the top right is your to-do list: overdue work and jobs due today. Every notification is a link - tap it and you land on that exact equipment.

# 2. Your daily flow

Everything starts in the Engineering Corner.

## The Engineering Corner

| Tab           | What it shows                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pending       | <b>Scheduled tasks ready to start</b> (created automatically from the maintenance plan), <b>ongoing work</b> you have already started, and anything <b>overdue</b> . |
| Upcoming PPM  | Planned maintenance for the next 30 days, so you can plan your visits.                                                                                               |
| Visit Reports | Everything you completed, grouped by day, ready to become a signed report.                                                                                           |

## Doing a scheduled job

1. Open **Engineering Corner**, stay on the **Pending** tab, and find the equipment.
2. If the work takes a while: press **Start Work** so everyone can see the machine is being worked on, do the job, then press **Mark Complete**.
3. If you did the job on the spot: press **Complete now** instead - it records the start and the finish in one go.

The form does the boring parts for you: your name is already filled in as the technician (change it if someone else did the work - new names are remembered and suggested next time), and dates start at today.

### Closing out a job

- **Service guide** - a collapsed reference list of the usual service steps for that equipment type. Open it if you want a reminder; there is nothing to tick.
- **Completion notes** - optional for scheduled work: tap a ready-made phrase ("No abnormalities", "Tested OK") or write your own. For breakdowns, notes are required.
- Press **Confirm**, or **Confirm & Generate Service Report** for a signed PDF of this single job straight away.

## Reporting a breakdown

1. Find the equipment. Quickest in the plant: **scan the QR sticker** on the machine with your phone camera - it opens that exact equipment.
2. Press **Put in Maintenance** and set **Reason** to **Breakdown**.
3. Set the priority and the expected completion date.
4. Describe what happened - required for breakdowns, because it is the story the next person needs.
5. Press **Confirm**. The machine is flagged as broken down and your administrator is alerted.

## Replacing a valve or NRV

Valves are replaced, not repaired. Open the valve and press **Replace Valve** (or **Replace NRV**), then enter the new valve's tag and details. The old valve is retired but its full history is kept, and the new one takes over the same position.

---

## 3. Visit reports

A day of work becomes a signed PDF in four taps.

1. Go to **Engineering Corner**, then the **Visit Reports** tab.
2. Pick a date range with the quick filters (Today, Last 7 days, and so on).
3. Find your visit day and press **Generate Report** - the report window opens already set to that day.
4. Enter who prepared and who approved the work, then **Preview** or **Download**. On a phone the PDF opens in your phone's own viewer or share sheet.

## 4. Quick reference

The short version - worth saving to your phone.

### I want to...

| Task                          | Where to go                                                                   |
|-------------------------------|-------------------------------------------------------------------------------|
| Start a scheduled job         | Engineering Corner, Pending tab, then <b>Start Work</b>                       |
| Record a job done on the spot | <b>Complete now</b> next to the task - one step                               |
| Finish a started job          | <b>Mark Complete</b> on the task, or <b>Mark Operational</b> on the equipment |
| Report a breakdown            | Scan the QR sticker, then <b>Put in Maintenance</b> , reason <b>Breakdown</b> |
| Replace a valve               | Open the valve, then <b>Replace Valve</b>                                     |
| See what is coming up         | Engineering Corner, <b>Upcoming PPM</b> tab                                   |
| Produce a visit report        | Engineering Corner, <b>Visit Reports</b> , then <b>Generate Report</b>        |
| Look up a machine's history   | Tap its name anywhere - the equipment page lists every job ever done          |

### Common questions

#### Why can I not see a plant or machine?

You only see the plants assigned to you. Ask your administrator to assign the plant.

#### It says the equipment already has an open work-order.

Somebody already started a job on that machine. Finish that one before starting another.

#### The breakdown form will not submit.

For breakdowns, describing what happened is required. For scheduled work, notes are optional.

#### Can I use it without internet?

Yes, for looking things up - the app opens with everything from your last sync and a banner showing how old the data is. Saving a job needs a connection; your entries stay in the form while you retry.

#### I did the work but forgot to record it.

Record it the same way when you remember - the completion date is editable, so the record can show the day the work was actually done.

**Need help?** Contact your administrator for anything to do with access, plants and equipment. The tool improves regularly; small on-screen differences from this guide are normal.
